Origins	Acumen CMS comes from AdOnMo and is presented as the technology backbone behind India's largest DOOH network.
Operational scale	Acumen CMS highlights a network powering 45,000+ screens in India with support across 26+ cities.
Primary industries served	Retail, QSR, education, healthcare, corporate offices, and other business environments.

Company and product overview

Acumen CMS is a cloud-based digital signage content management system. It is associated with AdOnMo and is described as the technology backbone behind one of India's largest DOOH networks. The platform is built to help businesses manage digital communication through one central dashboard, whether the requirement is for a single display in a cafe´ or a larger multi-location rollout.

Acumen CMS is a solution for intelligent, seamless, and impactful digital communication across business environments.

In practical terms, Acumen CMS combines software, screens, installation support, training, and operational assistance. The software is accessible through a browser-based console and is meant to simplify content upload, scheduling, playlist creation, screen grouping, user access, and remote content control.

What Acumen CMS offers

Cloud-based CMS software for content upload, scheduling, playlist creation, screen grouping, user role management, and remote monitoring.

Commercial-grade display screens, media players, and mounting accessories as part of the overall signage solution.

Assessment, installation, CMS integration, training, and technical support for operational use.

A scalable setup that can support a few screens or a much larger network from a single dashboard.

Screen formats and common use cases

Acumen CMS currently offers the following screen categories and standard sizes:

Screen format	Sizes	Common fit
Wall mount	24 inch, 32 inch, 43 inch, 55 inch	Common for QSRs and other businesses that need fixed in-store display screens.
A type standee	32 inch, 43 inch	Common for malls and retail stores.
Standing pods	43 inch, 55 inch	Common for healthcare clinics and retail environments.

These screens may be positioned for use cases such as digital menu boards, display boards, bulletin boards, notice boards, promotional advertising screens, and video-wall-related display needs.

Content handling and platform limitations

Supported content formats are JPEG, PNG, and MP4 only.

PDFs, live feeds, links, and third-party app-based content are not supported.

Content can be played one by one in sequence, but split-screen display is not supported.

The platform is primarily intended for display content and does not offer interactive or touch-screen features through the CMS.

How content is managed across locations

Acumen CMS supports centralized remote content management.

As long as the screen has Wi-Fi connectivity and power supply, content can be updated remotely. Different content can be assigned to different locations.

Within a location, content can also be categorized further through what is referred to as a tag level announcement, such as by floor, block, or screen grouping. If a store has multiple screens, those screens can be managed separately as required.

The system supports two types of user roles. The Admin role can add new users and make general changes. The General User role can make changes within the access provided.

The platform is designed for non- technical users as well, including store owners and managers, and is intended to be easy to operate once the basics are understood.

Scaling, compatibility, and purchase scope

There is no limitation on scaling up later or adding more screens in the future.

There is no limitation on the number of content pieces that can be displayed over time on the screen network.

Outdoor screens are not provided. Semi-indoor screens may be placed under shade and should not be exposed directly to dust, water, or sunlight.

Screens are not sold as a hardware-only product without the software. If a customer already has screens, Acumen can assess whether those screens are compatible with the software.

Compatibility assessment is handled by the technical team through a physical check.

For businesses that want advertising without purchasing a screen, we will route the lead to our main business Adonmo that deals with DOOH advertising

Delivery, support, production and warranty

Delivery timeline	If material is ready, delivery begins as soon as possible. If the screens are custom-made, the expected timeline is about 18 to 20 business working days.
Commercial condition	The process begins only after 70% of the payment is completed.

Production	We start production post receiving advance payment.
Support window	Technical support is available from 10:00 AM to 7:00 PM, with response aimed as soon and within 24 hours on weekends or holidays.
Warranty	One year warranty is provided. Fluctuation damage and external damage are not covered.
Issue priority	Any technical issue with the software is to be given high priority.

Operational notes and first-level troubleshooting

A screen may show as offline if there is an issue with the power supply. If a screen is not working properly or appears to lag, the first checks should be a restart, Wi-Fi connectivity, power connection, and whether all information has been updated correctly in the system.

One operational challenge noted is the possibility of screen damage during transportation, which may require case-specific assessment.

Where Acumen CMS fits best

Based on the website positioning and the approved FAQ inputs, Acumen CMS is best suited for businesses that need centrally managed digital communication across physical spaces.

The clearest fits include retail stores, QSRs, healthcare clinics, educational institutions, corporate offices, and other environments where screen-based messaging needs to be updated without manual device-by-device handling.
